

In the claims

1. (Currently Amended) A system for permitting a user to access data on a legacy system and an intranet, comprising:

~~a computer operable by the user to communicate with the legacy system over a communication network; and~~

a systems interface coupled to the legacy system, wherein the systems interface comprises at least one network address that can be accessed by ~~[[the]]~~ a computer over ~~[[the]]~~ a communication network,

wherein the systems interface is adapted to ~~route~~ direct communications from the computer from the at least one network address to a separate network address corresponding to the intranet that is distinct from the legacy system.

2. (Original) The system of claim 1, wherein the systems interface sends a command for the computer to launch a browser in order to route communications from the computer to the intranet.

3. (Original) The system of claim 2, wherein the command comprises an application program interface command.

4. (Original) The system of claim 1, wherein the systems interface comprises a first server for managing protocol regarding the computer and a second server for generating transactions regarding the legacy systems.

5. (Original) The system of claim 4, wherein the at least one network address comprises a first IP address corresponding to the first server and a second IP address corresponding to the second server, and wherein the separate network address comprises a third IP address.

6. (Currently Amended) The system of claim 4, wherein the second server sends a command to the first server to ~~route~~ direct the computer to the separate network address in order to ~~route~~ direct communications from the computer to the intranet.

7. (Currently Amended) The system of claim 4, wherein the systems interface sends at least one command for the computer to launch a browser and for the first server to ~~route~~ direct the computer to the separate network address in order to ~~route~~ direct communications from the computer to the intranet.
8. (Currently Amended) The system of claim 1, wherein the computer is running application-specific client software to enable the computer to access the information from the legacy system, comprising ~~causing~~ a browser to be launched at the computer to ~~route~~ direct communications from the computer to the intranet, and wherein the browser is displayed at the computer as an active window with the application-specific client software being minimized or hidden behind the active window.
9. (Currently Amended) The system of claim 8, wherein the computer is logged into the systems interface using the application-specific client software, and wherein the computer remains logged into the systems interface and the application-specific client software remains an active application after the communications are ~~routed~~ directed to the intranet.
10. (Currently Amended) The system of claim 1, wherein the computer is running application-specific client software to access the information from the legacy system, wherein the application-specific client software is presenting a GUI page to the user, and wherein the GUI page includes an icon or software button that can be selected or engaged by the user to initiate the ~~routing~~ directing.
11. (Currently Amended) A system for permitting a user to access data, comprising:
a computer operable by the user to access information from a legacy system; and
means for providing an interface between the computer and the legacy system, the means having at least a first network address, wherein the means for providing an interface is adapted to ~~route~~ direct communications from the computer from the first

network address to a second network address providing access to an intranet that is distinct from the legacy system in response to a user input.

12. (Original) The system of claim 11, wherein the user input comprises engagement of a software key by the user.

13. (Original) The system of claim 11, wherein the means for providing an interface comprises at least one protocol server and at least one transaction server, wherein the at least one protocol server provides an interface between the computer and the at least one transaction server, and wherein the at least one transaction server receives requests and generates legacy system transactions.

14. (Currently Amended) The system of claim 13, wherein the means for providing an interface issues at least one command that causes the computer to launch a browser and that causes the at least one protocol server to ~~route~~ direct the computer from the first network address to the second network address.

15. (Currently Amended) A method for accessing data, comprising:
logging a computer onto a systems interface that permits remote access of legacy systems;
accessing the systems interface at a first network address;
providing a user input for accessing an intranet that is distinct from the legacy systems;
launching a browser in response to a command from the systems interface; and
accessing the intranet separately from the legacy systems at a separate network address.

16. (Original) The method of claim 15, wherein the systems interface comprises a first server and a second server, wherein the first server provides an interface between the computer and the second server, wherein the first server has the first network address,

wherein the second server is adapted to receive requests and generate legacy transactions, and wherein the second server has a second network address.

17. (Original) The method of claim 16, wherein the computer is logged into the first server.

18. (Original) The method of claim 16, wherein the step of providing a user input comprises one of selecting an icon and engaging a software button.

19. (Original) The method of claim 16, wherein the command comprises an application program interface command issued by the first server or the second server.

20. (Original) The method of claim 15, further comprising the step of displaying a technician home page corresponding to the separate network address.

21. (Original) The method of claim 20, further comprising the step of retrieving local information from the intranet, the local information comprising one or more of: cross-box locations, pricing information, service information cable records, and plat records.

22. (Original) The method of claim 21, further comprising the step of returning to the systems interface.

23. (Currently Amended) A method for permitting a user to access data, comprising:
authenticating a computer attempting to log onto a systems interface to legacy systems;

providing access to the systems interface, the systems interface corresponding to at least one network address;

receiving and processing at the systems interface a request for access to an intranet that is distinct from the legacy systems;

sending a message to the computer, the message causing the computer to launch a software application that seeks out a separate network address on the intranet; and

~~routing directing~~ communications from the computer from the systems interface to the separate network address.

24. (Original) The method of claim 23, wherein the systems interface comprises a first server having a first network address and a second server having a second network address, wherein the first server is for providing a protocol interface between the computer and the second server, and wherein the second server is for processing requests and generating legacy transactions.

25. (Currently Amended) The method of claim 24, wherein the step of ~~routing~~ directing comprises ~~routing directing~~ communications from the computer from the first network address to the separate network address.

26. (Original) The method of claim 24, wherein the request is based on user selection is of an icon or a software button.

27. (Original) The method of claim 24, wherein the message comprises an application program interface command and wherein the software application is a browser.

28. (Currently Amended) A system for permitting a user to access data by employing a computer to access information from legacy systems, wherein the computer is running application-specific client software to access the information from legacy systems and wherein the application-specific client software displays a first window with a software button that can be engaged to initiate a request for access to an intranet, the system comprising:

~~a computer employed by the user to access information from legacy systems, wherein the computer is running application-specific client software to access the information from legacy systems;~~

~~wherein the application-specific client software displays a first window with a software button that can be engaged to initiate a request for access to an intranet;~~

a systems interface to the legacy systems, the systems interface including a protocol server and a transaction server, the protocol server having a first network address and the transaction server having a second network address;

wherein the transaction server issues at least one message in response to the request, the at least one message causing the computer to launch a browser application as a second window, and the at least one message causing communications from the computer to be ~~outed~~ directed from the first network address to a third network address corresponding to the intranet that is distinct from the legacy systems; and

~~wherein the application-specific client software remains an active application, the user being able to toggle between the first window and the second window.~~
